## Description

The interfaces between humans and technical user interfaces are becoming more and more intuitive, replacing traditional interfaces such as mouse and keyboard. In addition to multitouch interfaces, which enable natural movements and provide haptic feedback, touchless interfaces via gesture, speech and object recognition are becoming the focus of interaction control. Interaction interfaces move away from physical gadgets and integrate into our world. Voice control is becoming a dominant interface in our daily environment, e.g. for controlling smart home and e-commerce applications.
