Description

Supporting and immersive technologies open up enormous potential in the working environment: conferences in Social VR save travel costs and hectic workflows for employees of international companies. Product development and market research will also take place in the VR in the future. Shopper travels will be presented virtually and will replace physical test markets. In the industrial context, augmented and mixed reality will support maintenance and assembly teams. Augmented reality can replace X-ray images for operations and thus reduce radiation exposure for the patient. Complete access to the right knowledge in the right place makes the virtual workplace of the future so valuable.
