Description

Wearable technology stands for accessories and clothing that are embedded in electronic components or made of intelligent materials and provide digital help to the user in his activities in the real world. Examples include bracelets, plasters, temporary tattoos and garments that analyze and optimize our stress levels and sleep rhythms. Many of these devices are connected to each other or to our smartphones and offer us things like self-tracking and mobile payment options. The miniaturization of computer chips enables the integration of smart applications into more and more wearables.
