## Description

The trend towards online and card payment instead paying in cash is having an impact on transport payment systems - this will increase over the coming years.

- Electronic payments are already very present in transport (e.g. Uber and Careem) and generally perceived positively
- Bitcoin and other cryptocurrencies have grown exponentially during the past few years and may strengthen the move away from traditional money
- Some transport users who rely on cash may be disadvantaged by payment systems that are exclusively card-based or online
