### Description

In the future, virtual spaces and physical experience installations will be perceived with all the senses. The entire range of senses will be played in harmony with audiovisual content, thus reinforcing the emotions. Haptic full-body suits make it possible not only to see virtual objects but also to feel them through vibrations, pressure and temperature. In addition, perceived air circulation, lighting design, aromas and flavours transform artificial experiences into real memories. The possibilities of simulating sensory experiences are also used in spatial planning and design at the workplace, for wellness services and as support for changing behaviour.
